# Assignment 5 (or Final project)

Correlation distributions of different GNM methods with conservation scores

**You may get good correlations between between GNM-BF and ConSURF scores. But it is highly likely that you will get very bad correlations.**

**Now, instead of presenting the results as they are, you may need to think of why they are so - not any reasons but those that are supported by evidence. And then draw your conclusions from your calculations.**

From GNM to  
Contact number

## Flexibility and packing in proteins

Halle showed that

$$\sigma_k = \int C^{-1} d\mathbf{r}_k \mathbf{r}_k^T \mathbf{r}_k \exp(-\beta W(\mathbf{r}_k))$$

$$\beta W(\mathbf{r}_k) \sim \lambda_k \mathbf{r}_k^T \mathbf{r}_k$$

$$\sigma_k = \frac{3}{2\lambda_k} = \left(\frac{3}{2\lambda_k}\right) \left(\frac{1}{n_k}\right)$$

# Ignoring off-diagonal elements of the Hessian matrix

$$H = \begin{pmatrix} h_{11} & h_{12} & h_{13} & \dots \\ h_{21} & h_{22} & h_{23} & \dots \\ h_{31} & h_{32} & h_{33} & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix} \sim \begin{pmatrix} h_{11} & 0 & 0 & \dots \\ 0 & h_{22} & 0 & \dots \\ 0 & 0 & h_{33} & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix}$$

$$C = H^{-1} = \begin{pmatrix} h_{11}^{-1} & 0 & 0 & \dots \\ 0 & h_{22}^{-1} & 0 & \dots \\ 0 & 0 & h_{33}^{-1} & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix} = \begin{pmatrix} \frac{1}{z_1} & 0 & 0 & \dots \\ 0 & \frac{1}{z_2} & 0 & \dots \\ 0 & 0 & \frac{1}{z_3} & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix}$$

## Comparison between GNM and Contact Number (CN)

Table 1. Indicators for model predictions of  $C_{\alpha}$  AMSDs for full protein set

	Model	Density*	$\langle \Delta \rangle^{\dagger}$	Range of $\Delta$	$\langle \rho \rangle^{\dagger}$	Range of $\rho$
<i>a</i>	LDM	all/ref/fix	$0.89 \pm 0.27$	0.63–2.19	$0.62 \pm 0.09$	0.41–0.80
<i>b</i>	LDM	all/ref/scd	$0.86 \pm 0.26$	0.62–2.09	$0.64 \pm 0.09$	0.43–0.81
<i>c</i>	LDM	all/xtl/fix	$0.75 \pm 0.12$	0.52–1.21	$0.67 \pm 0.09$	0.45–0.83
<i>d</i>	LDM	all/xtl/scd	$0.72 \pm 0.11$	0.53–1.13	$0.70 \pm 0.09$	0.49–0.85
<i>e</i>	P-GNM	$C_{\alpha}$ /ref/fix	$1.08 \pm 0.42$	0.65–3.06	$0.58 \pm 0.17$	0.05–0.84
<i>f</i>	LDM	$C_{\alpha}$ /ref/fix	$1.02 \pm 0.32$	0.74–2.58	$0.51 \pm 0.11$	0.20–0.70
<i>g</i>	LDM	$C_{\alpha}$ /ref/scd	$0.97 \pm 0.29$	0.68–2.32	$0.58 \pm 0.08$	0.42–0.75

## Comparison between GNM, CN and WCN

**Table I**

*The Performance Breakdown of the WCN Model, the CN Model and the GNM for the Structures Classified According to the SCOP Classes*

SCOP classes	WCN		CN		GNM	
	$\bar{c}$	$\rho_{0.5}$	$\bar{c}$	$\rho_{0.5}$	$\bar{c}$	$\rho_{0.5}$
All- $\alpha$ proteins	0.59	0.73	0.47	0.43	0.54	0.68
All- $\beta$ proteins	0.64	0.82	0.51	0.58	0.58	0.73
$\alpha/\beta$ proteins	0.62	0.82	0.49	0.51	0.57	0.75
$\alpha + \beta$ proteins	0.60	0.77	0.49	0.51	0.54	0.65

# CN and WCN

Contact Number

$$C_k = \sum_i H(r_{ik} - r_{\text{cutoff}})$$

Weighted Contact Number

$$W_k = \sum_i \frac{1}{r_{ki}^2}$$

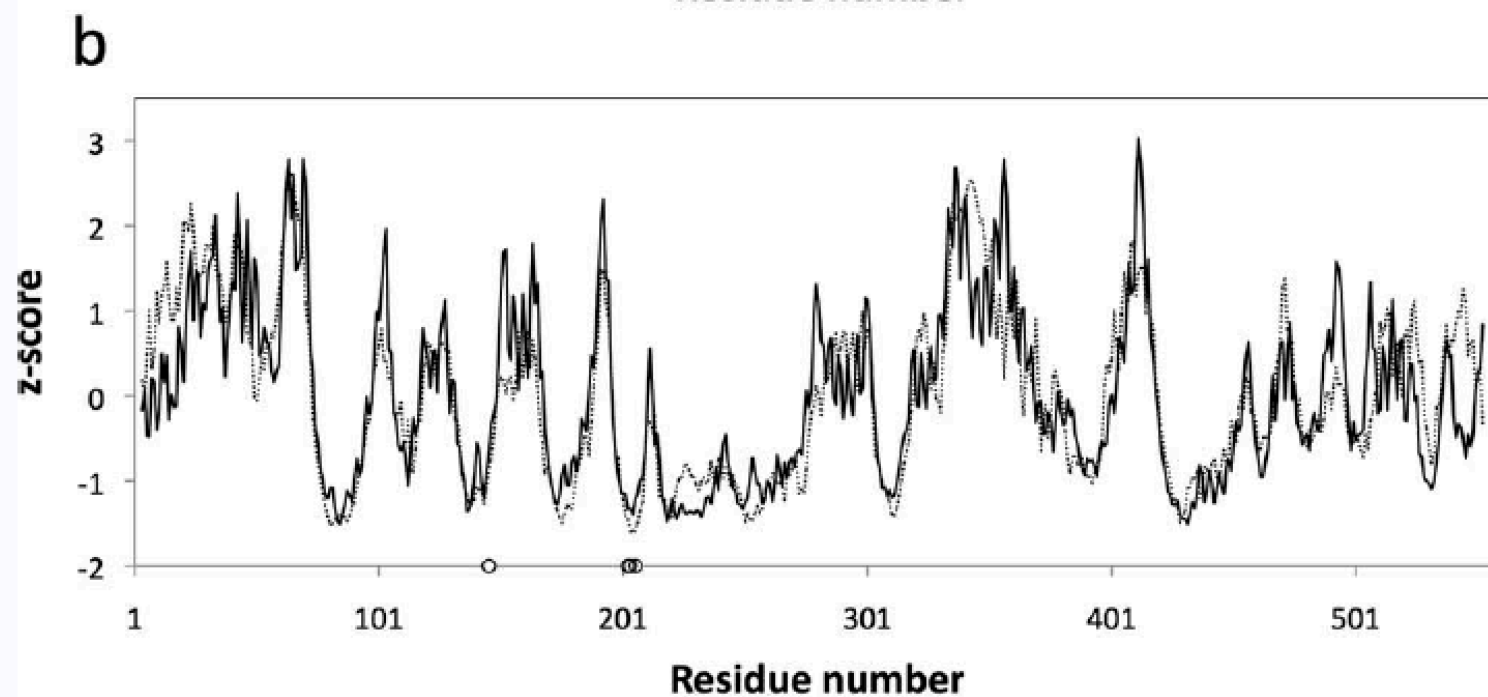

The link between contact  
number and conservation

# The distribution of the correlations between WCN and conservation

Average correlation coefficient for 554 structures is 0.57

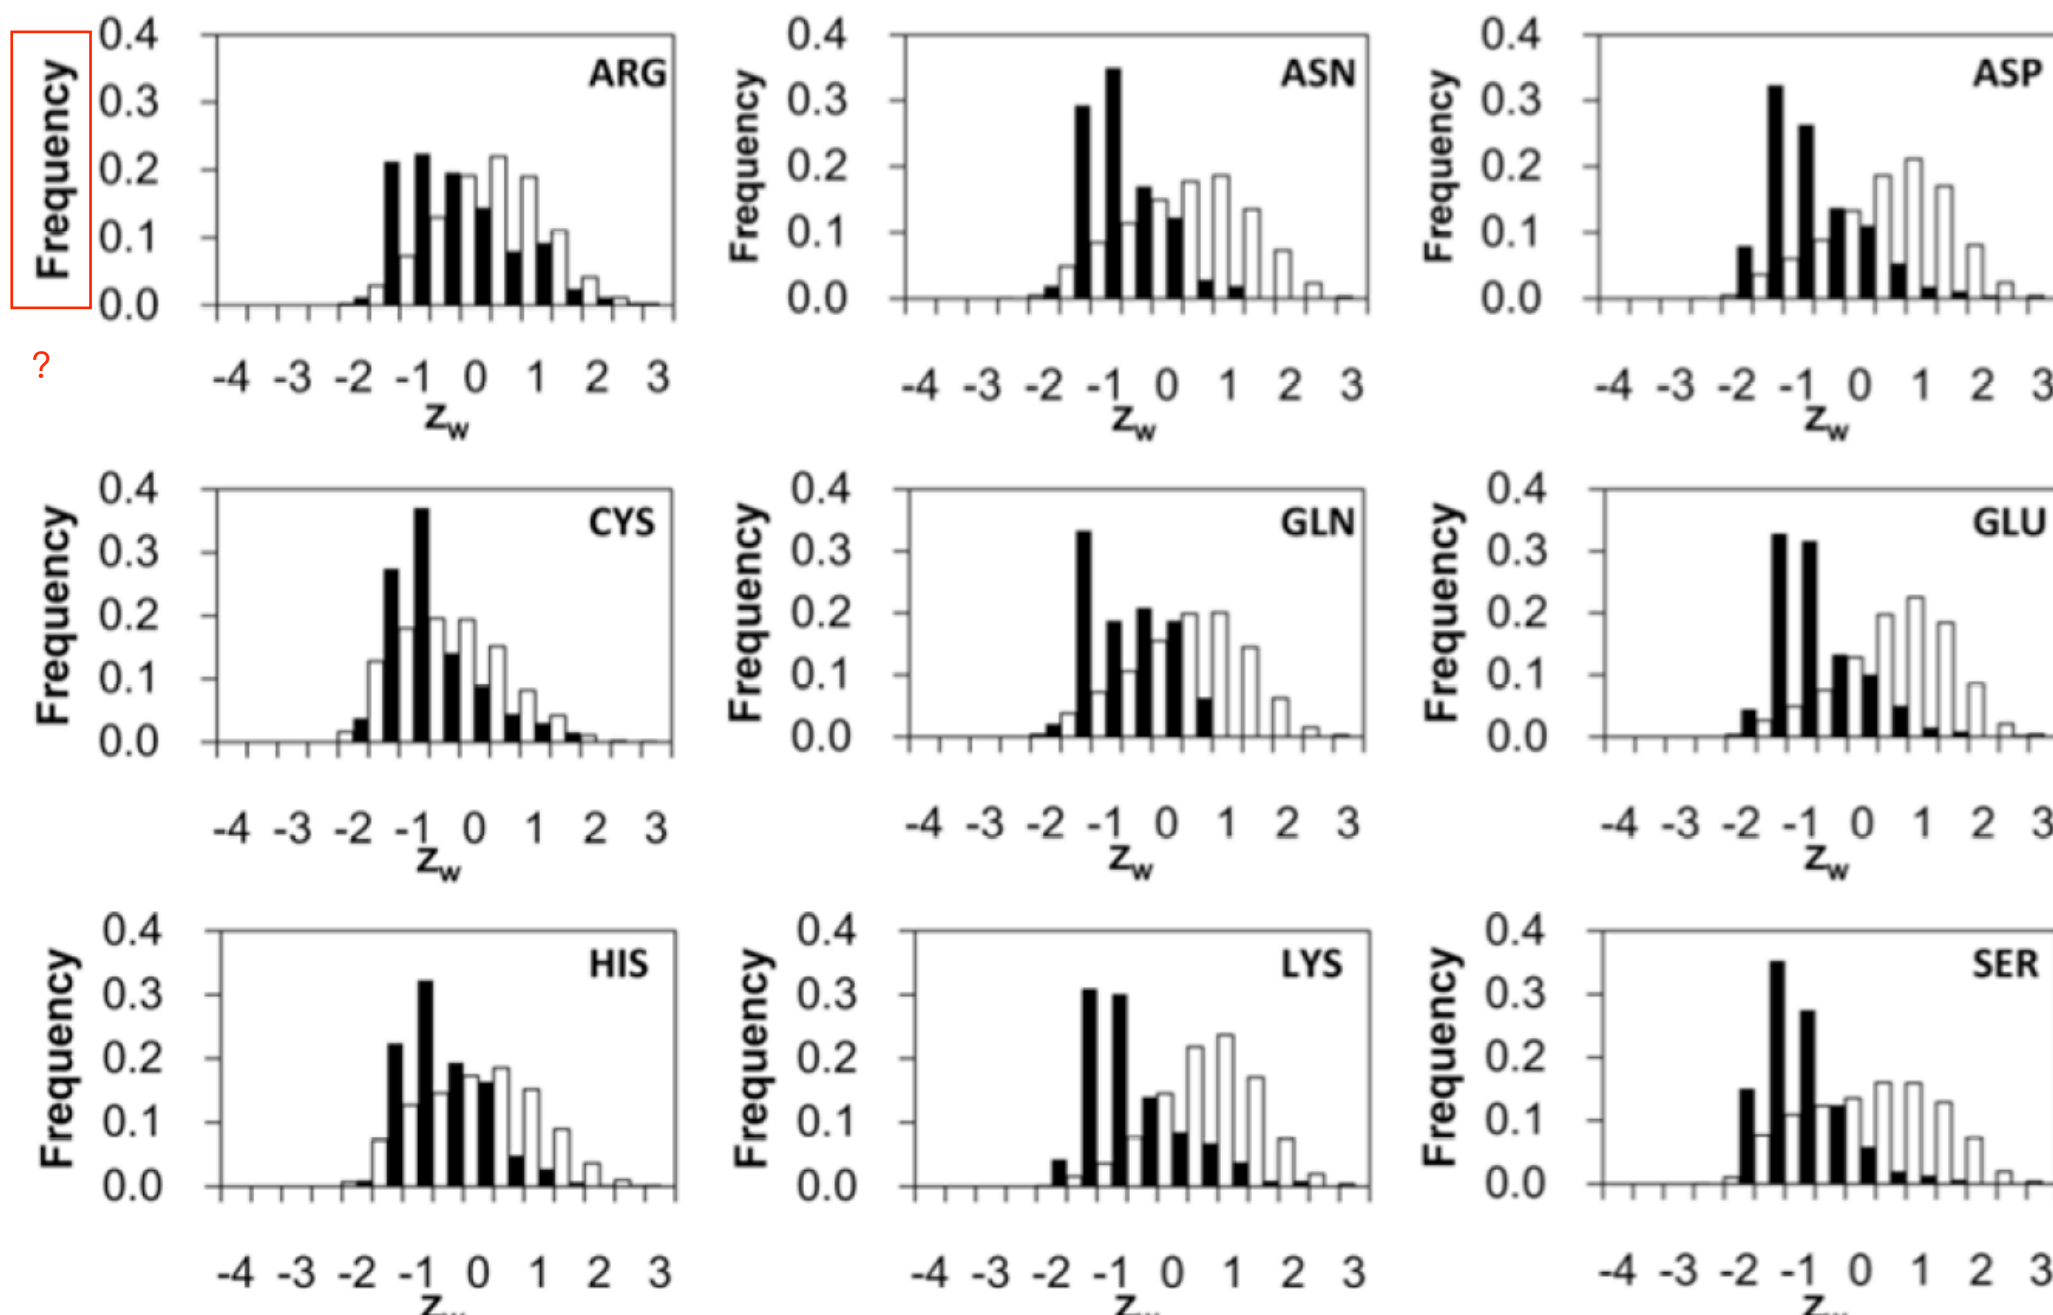

## WCN vs. Conservation

1. The BF is correlated with GNM-B factors and WCN and CN (published)
2. The WCN and CN is associated with conservation (published)
3. **Is BF associated with conservation - your final project?**

# The distribution of WCN of catalytic amino acids

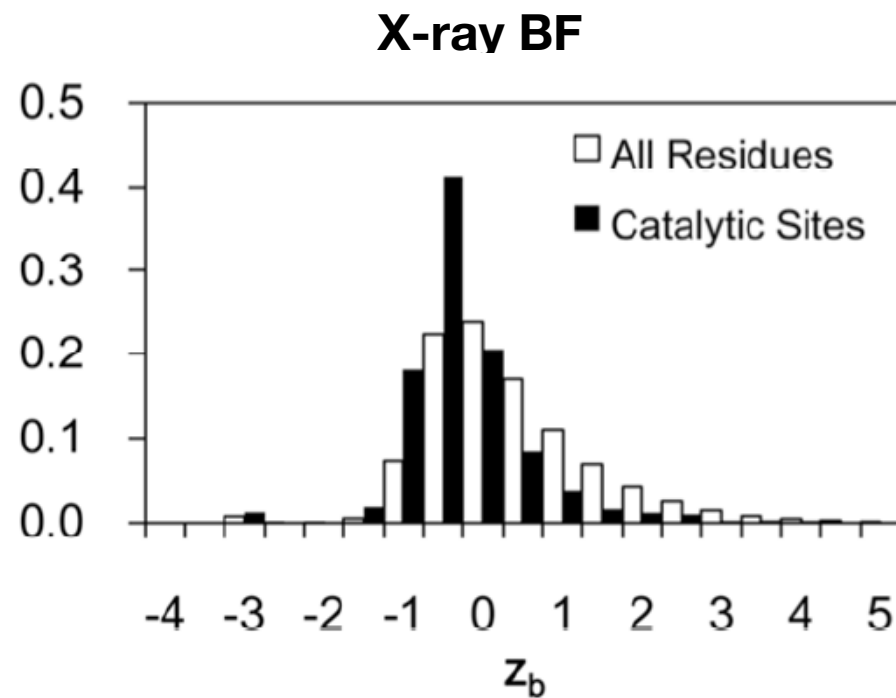

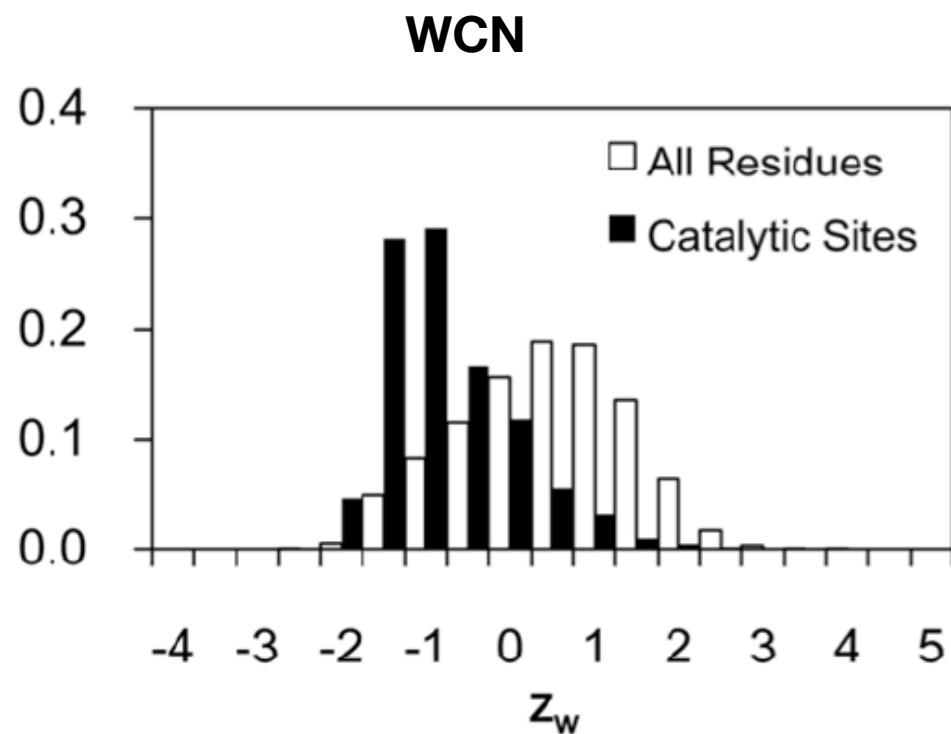

# The distribution of WCN of an amino acid type

Catalytic residues  
among the most considered residues

# Comparison between WCN and X-ray BF distributions of catalytic residues vs. other residues

Not promising

# prediction of catalytic residues

# prediction of catalytic residues

# prediction of catalytic residues

# Why BF is not good at predicting catalytic residues?

If **B factors** appear to be correlated well with **WCN** and **CN** (published), and **WCN** is shown to be correlated well with **conservation scores** and is a good predictor of catalytic residues, then why **B-factors** are such a poor predictor of catalytic residues?

One of the reasons is that the values of X-ray B-factors are subject to the changes of many factors such as crystallization conditions, refinement methods, temperatures...

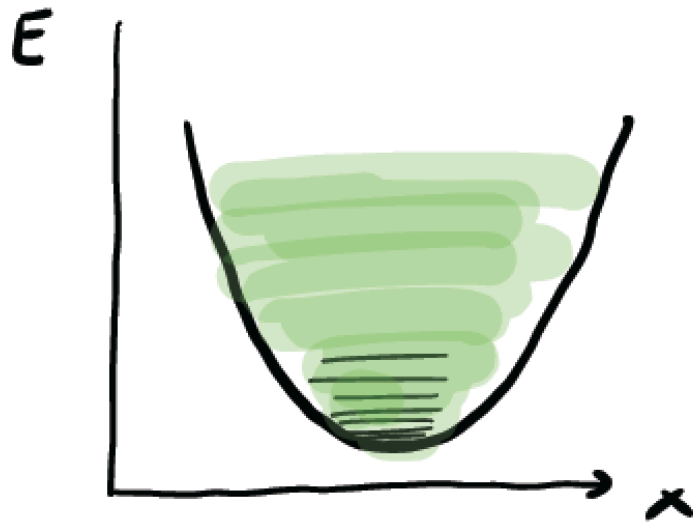

# The x-rat B-factor profiles are different even for the same protein

1. The **GNM-BF** is correlated with GNM-B factors and WCN and CN (published)
2. The WCN and CN is associated with conservation (published)
3. Is **GNM-BF** associated with conservation – your final project?
